Motivation

F/E R, b Image courtesy: Collins 3

Topics of Today

Compute the

- Fundamental matrix given corresponding points
- Essential matrix given corresponding points
- Rotation matrix and basis given an essential matrix

Computing the Fundamental Matrix Given Corresponding Points

Fundamental Matrix

The fundamental matrix F is

$$\mathsf{F} = (\mathsf{K}')^{-\mathsf{T}} \mathsf{R}' \mathsf{S}_b \mathsf{R}''^{\mathsf{T}} (\mathsf{K}'')^{-1}$$

- It encodes the relative orientation for two uncalibrated cameras
- Coplanarity constraint through F

$$\mathbf{x'}^{\mathsf{T}}\mathsf{F}\mathbf{x''} = 0$$

Fundamental Matrix

The fundamental matrix F can directly be computed if we know the

- K', K'' calibration matrices
- R', R'' viewing direction of the cameras
- S_b
 baseline
- $\hfill \hfill \hfill$

How to compute F given ONLY corresponding points in images?

Problem Formulation

Given: N corresponding points

 $(x', y')_n, (x'', y'')_n$ with n = 1, ..., N

Wanted: fundamental matrix F

Fundamental Matrix From Corresponding Points

 For each point, we have the coplanarity constraint

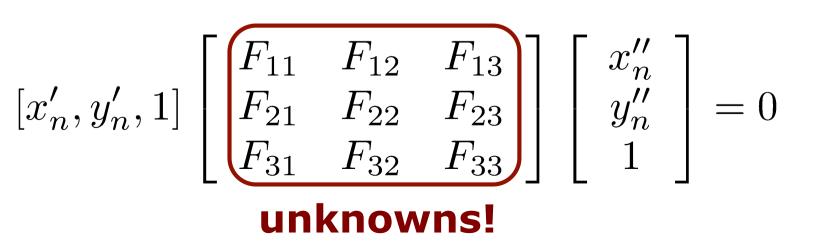

$$\mathbf{x'}_{n}^{\mathsf{T}}\mathsf{F}\mathbf{x}_{n}^{\prime\prime}=0 \qquad n=1,...,N$$

Fundamental Matrix From Corresponding Points

 For each point, we have the coplanarity constraint

$$\mathbf{x'}_{n}^{\mathsf{T}}\mathsf{F}\mathbf{x}_{n}^{\prime\prime}=0 \qquad n=1,...,N$$

or

What is the Issue here?

- In standard least squares problems, we have a vector of unknowns
- Here, the matrix elements of F are the unknowns

Question: How to turn the unknown matrix elements into a vector of unknowns?

$$\begin{bmatrix} x'_n & y'_n & 1 \end{bmatrix} \begin{bmatrix} F_{11} & F_{12} & F_{13} \\ F_{21} & F_{22} & F_{23} \\ F_{31} & F_{32} & F_{33} \end{bmatrix} \begin{bmatrix} x''_n \\ y''_n \\ 1 \end{bmatrix} = 0$$

$$x_n''F_{11}x_n' + x_n''F_{21}y_n' + \ldots = 0$$

$$\begin{bmatrix} x'_n y'_n 1 \end{bmatrix} \begin{bmatrix} F_{11} & F_{12} & F_{13} \\ F_{21} & F_{22} & F_{23} \\ F_{31} & F_{32} & F_{33} \end{bmatrix} \begin{bmatrix} x''_n \\ y''_n \\ 1 \end{bmatrix} = 0$$

$$x_n''F_{11}x_n' + x_n''F_{21}y_n' + \ldots = 0$$

$$\begin{bmatrix} x'_n, y'_n \\ 1 \end{bmatrix} \begin{bmatrix} F_{11} & F_{12} & F_{13} \\ F_{21} & F_{22} & F_{23} \\ F_{31} & F_{32} & F_{33} \end{bmatrix} \begin{bmatrix} x''_n \\ y''_n \\ 1 \end{bmatrix} = 0$$

$$x_n''F_{11}x_n' + x_n''F_{21}y_n' + \dots = 0$$

$$\begin{bmatrix} x'_{n}, y'_{n}, 1 \end{bmatrix} \begin{bmatrix} F_{11} & F_{12} & F_{13} \\ F_{21} & F_{22} & F_{23} \\ F_{31} & F_{32} & F_{33} \end{bmatrix} \begin{bmatrix} x''_{n} \\ y''_{n} \\ 1 \end{bmatrix} = 0$$

$$[x_n''x_n', x_n''y_n', x_n'', y_n''x_n', y_n''y_n', y_n'', x_n', y_n', 1] \cdot [F_{11}, F_{21}, F_{31}, F_{12}, F_{22}, F_{32}, F_{13}, F_{23}, F_{33}]^{\mathsf{T}} = 0$$
$$n = 1, \dots, N$$

• Linear function in the unknowns F_{ij}

 $a_{n}^{\mathsf{T}} \longrightarrow [x_{n}''x_{n}', x_{n}''y_{n}', x_{n}'', y_{n}''x_{n}', y_{n}''y_{n}', y_{n}'', x_{n}', y_{n}', 1] \cdot \mathbf{f} \longrightarrow [F_{11}, F_{21}, F_{31}, F_{12}, F_{22}, F_{32}, F_{13}, F_{23}, F_{33}]^{\mathsf{T}} = 0$ $n = 1, \dots, N$

$$\boldsymbol{a}_n^\mathsf{T} \mathbf{f} = 0 \qquad n = 1, ..., N$$

Using the Kronecker Product

• Linear function in the unknowns F_{ij}

 $a_{n}^{\mathsf{T}} \longrightarrow [x_{n}''x_{n}', x_{n}''y_{n}', x_{n}'', y_{n}''x_{n}', y_{n}''y_{n}', y_{n}'', x_{n}', y_{n}', 1] \cdot \mathbf{f} \longrightarrow [F_{11}, F_{21}, F_{31}, F_{12}, F_{22}, F_{32}, F_{13}, F_{23}, F_{33}]^{\mathsf{T}} = 0$ n = 1, ..., N

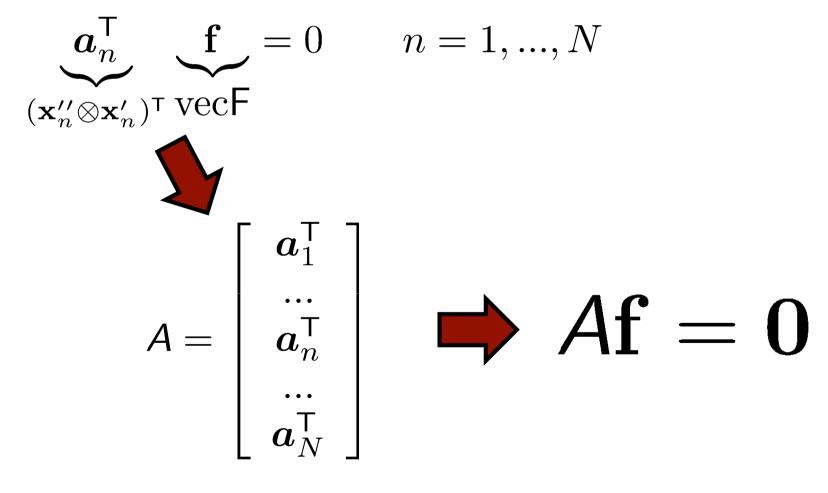

$$(\mathbf{x}_n'' \otimes \mathbf{x}_n')^{\mathsf{T}} \operatorname{vec} \mathsf{F} = \underbrace{\mathbf{a}_n^{\mathsf{T}}}_{(\mathbf{x}_n'' \otimes \mathbf{x}_n')^{\mathsf{T}}} \underbrace{\mathbf{f}}_{\mathsf{vec}} = 0 \qquad n = 1, ..., N$$

(it holds in general: $\mathbf{x}^{\mathsf{T}}\mathsf{F}\mathbf{y} = (\mathbf{y} \otimes \mathbf{x})^{\mathsf{T}} \mathrm{vec}\mathsf{F}$)

Linear System From All Points

 We directly obtain a linear system if we consider all N points

Solving the Linear System

Singular value decomposition solves

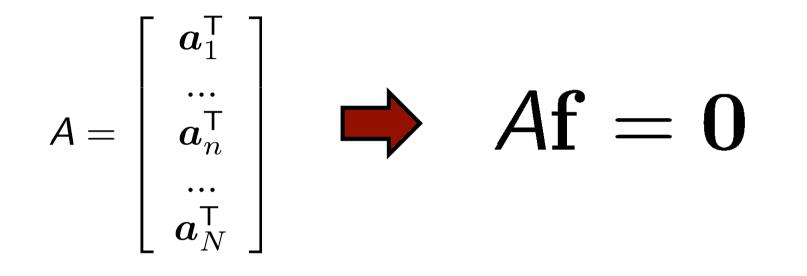

$$Af = 0$$

and thus provides a solution for

 $\mathbf{f} = [F_{11}, F_{21}, F_{31}, F_{12}, F_{22}, F_{32}, F_{13}, F_{23}, F_{33}]^{\mathsf{T}}$

 SVD: f is the right-singular vector corresponding to a singular value of A that is zero

How Many Points Are Needed? The vector f has 9 dimensions

How Many Points Are Needed? The vector f has 9 dimensions

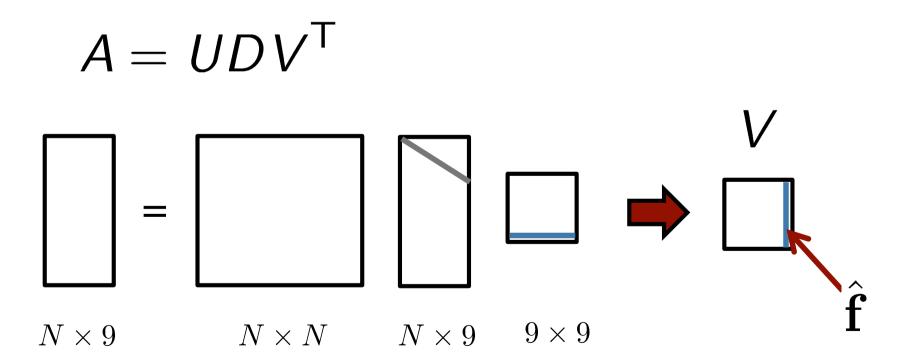

Matrix A has at most rank 8
We need 8 corresponding points

More Than 8 Points...

- In reality: noisy measurements
- With more than 8 points, the matrix A will become regular (but should not!)
- Use the singular vector \hat{f} of A that corresponds to the **smallest** singular value is the solution $\hat{f} \to \hat{F}$

Singular Vector

- Use the singular vector \hat{f} of A that corresponds to the **smallest** singular value is the solution $\hat{f} \to \hat{F}$

8-Point Algorithm 1st Try

```
1 function F = F_from_point_pairs(xs, xss)
2 % xs, xss: Nx3 homologous point coordinates, N > 7
3 % F: 3x3 fundamental matrix
4
5 % coefficient matrix
6 for n = 1 : size(xs, 1)
7         A(n, :) = kron(xss(n, :), xs(n, :));
8 end
9
```

8-Point Algorithm 1st Try

```
function F = F_from_point_pairs(xs, xss)
1
  % xs, xss: Nx3 homologous point coordinates, N > 7
\mathbf{2}
  % F:
        3x3 fundamental matrix
3
4
  % coefficient matrix
5
  for n = 1 : size(xs, 1)
      A(n, :) = kron(xss(n, :), xs(n, :));
  end
8
9
  % singular value decomposition
10
   [U, D, V] = svd(A);
11
12
   % select the singlar vector with the minimal singular value
13
  F = reshape(V(:, 9), 3, 3);
14
                           singular vector of the
                           smallest singular value
     Not necessarily a matrix of rank 2
     (but F should have: rank(F)=2)
```

Enforcing Rank 2

- We want to enforce a matrix F with rank(F) = 2
- F should approximate our computed matrix F as close a possible

What to do?

Enforcing Rank 2

- We want to enforce a matrix F with rank(F) = 2
- F should approximate our computed matrix F as close a possible
- Use a second SVD (this time of F̂)

$$F = UD^{a}V^{\mathsf{T}} = U\text{diag}(D_{11}, D_{22}, 0)V^{\mathsf{T}}$$

with $\text{svd}(\hat{\mathsf{F}}) = UDV^{\mathsf{T}}$
and $D_{11} \ge D_{22} \ge D_{33}$

8-Point Algorithm

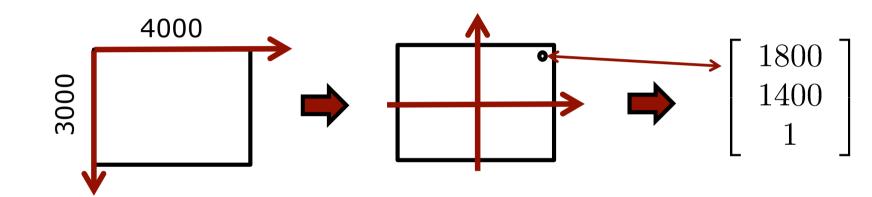

```
function F = F_from_point_pairs(xs, xss)
1
  % xs, xss: Nx3 homologous point coordinates, N > 7
\mathbf{2}
        3x3 fundamental matrix
  % F:
3
4
5 % coefficient matrix
  for n = 1 : size(xs, 1)
6
       A(n, :) = kron(xss(n, :), xs(n, :));
7
  end
8
9
   % singular value decomposition
10
   [U, D, V] = svd(A);
11
12
   % approximate F, possibly regular
13
14 Fa = reshape(V(:, 9), 3, 3);
15
```

8-Point Algorithm

```
function F = F_from_point_pairs(xs, xss)
1
  % xs, xss: Nx3 homologous point coordinates, N > 7
\mathbf{2}
        3x3 fundamental matrix
  % F:
3
4
5 % coefficient matrix
  for n = 1 : size(xs, 1)
6
       A(n, :) = kron(xss(n, :), xs(n, :));
7
  end
8
9
   % singular value decomposition
10
   [U, D, V] = svd(A);
11
12
   % approximate F, possibly regular
13
   Fa = reshape(V(:, 9), 3, 3);
14
15
  % svd decomposition of F
16
   [Ua, Da, Va] = svd(Fa);
17
18
   % algebraically best F, singular
19
   F = Ua * diag([Da(1, 1), Da(2, 2), 0]) * Va';
20
```

Well-Conditioned Problem

Example image 12MPixel camera

Ill-conditioned, numerically instable

Conditioning/Normalization to Obtain a Well-Conditioned Problem

- Normalization of the point coordinates substantially **improves** the **stability**
- Transform the points so that the center of mass of all points is at (0,0)
- Scale the image so that the x and y coordinated are within [-1,1]

Conditioning/Normalization

- Define $T : Tx = \hat{x}$ so that coordinates are zero-centered and in [-1,1]
- Determine fundamental matrix F from the transformed coordinates

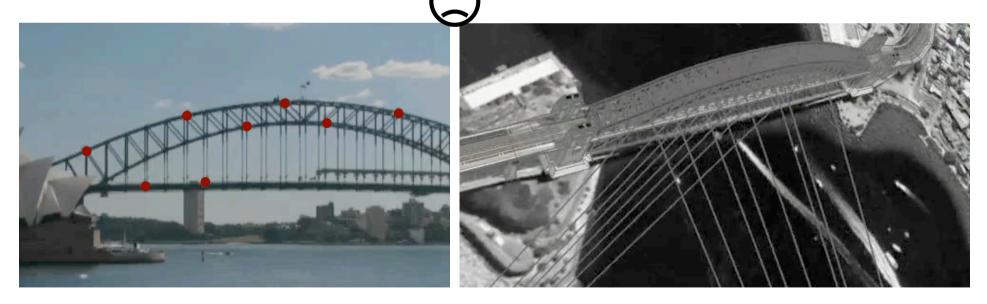

$$\mathbf{x'}^{\mathsf{T}} \mathsf{F} \mathbf{x}'' = (\mathsf{T}^{-1} \hat{\mathbf{x}}')^{\mathsf{T}} \mathsf{F} (\mathsf{T}^{-1} \hat{\mathbf{x}}'')$$
$$= \hat{\mathbf{x}'}^{\mathsf{T}} \mathsf{T}^{-\mathsf{T}} \mathsf{F} \mathsf{T}^{-1} \hat{\mathbf{x}}''$$
$$= \hat{\mathbf{x}'}^{\mathsf{T}} \hat{\mathsf{F}} \hat{\mathbf{x}}''$$

Obtain essential matrix F through

$$\overrightarrow{\mathsf{F}} = \mathsf{T}^{-\top}\mathsf{F}\mathsf{T}^{-1} \\ \mathsf{F} = \mathsf{T}^{\top}\widehat{\mathsf{F}}\mathsf{T}$$

Singularity – Points on a Plane

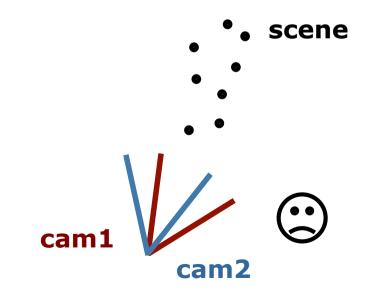

- If all corresponding points lie on a plane, then rank(A) < 8
- Numerically instable if points are close to a plane

Images from the "Fundamental Matrix Song" Video by D. Wedge

Singularity – No Translation

- The projection centers of both cameras are identical: $X_{O'} = X_{O''}$
- This happens if the translation of the camera is zero between both images

Summary so far

- Estimating the fundamental matrix from N pairs of corresponding points
- Direct solution of N>7 points based on solving a homogenous linear system ("8-Point Algorithm")

Computing the Fundamental Matrix Given 7 Corresponding Points

- We know that the fundamental matrix has seven degrees of freedom
- There exists a direct solution for 7 pts

The solution itself is more complex, so just the idea should matter here

- We know that the fundamental matrix has seven degrees of freedom
- There exists a direct solution for 7 pts
- Idea: 2-dimensional null space of A
- Matrix F must fulfill $\mathbf{f} = \lambda \mathbf{f}_1 + (1 \lambda) \mathbf{f}_2$

↑ ↑ vectors spanning the null space

- We know that the fundamental matrix has seven degrees of freedom
- There exists a direct solution for 7 pts
- Idea: 2-dimensional null space of A
- Matrix F must fulfill $\mathbf{f} = \lambda \mathbf{f}_1 + (1 \lambda) \mathbf{f}_2$
- We also know that the determinant of the 3x3 matrix must be zero: $|\mathsf{F}| = 0$

- We know that the fundamental matrix has seven degrees of freedom
- There exists a direct solution for 7 pts
- Exploit
 - 2-dimensional null space of A
 - Determinant of the 3x3 matrix must be zero: $|\mathsf{F}| = 0$

Summary so far

- Estimating the fundamental matrix from N pairs of corresponding points
- Direct solution of N>7 points based on solving a homogenous linear system ("8 point algorithm")
- Idea for a direct solution with 7 points (up to 3 solutions)

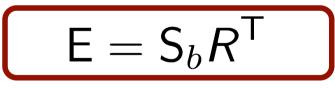

Let's Do the Same for the Essential Matrix

Reminder: Essential Matrix

 Essential matrix = "fundamental matrix for calibrated cameras"

$$\mathsf{E} = \mathsf{R}'\mathsf{S}_b\mathsf{R}''^\mathsf{T}$$

 Often parameterized through (general parameterization of dependent images)

Coplanarity constraint for calibrated

cameras

$$k \mathbf{x'}^\mathsf{T} \mathsf{E}^k \mathbf{x''} = 0$$

Essential Matrix from 8+ Corresponding Points

 For each point, we have the coplanarity constraint

$${}^{k}\mathbf{x'}_{n}^{\mathsf{I}} \mathsf{E} {}^{k}\mathbf{x}_{n}^{\prime\prime} = 0 \qquad n = 1, ..., N$$

Note: Same equation as for the fundamental matrix but for the points in the camera c.s. Remember: ^kx' = (K')⁻¹x'

Essential Matrix from 8+ Corresponding Points

 For each point, we have the coplanarity constraint

$${}^{k}\mathbf{x'}_{n}^{\mathsf{I}} \mathsf{E} {}^{k}\mathbf{x}_{n}^{\prime \prime} = 0 \qquad n = 1, ..., N$$

or

$$\begin{bmatrix} {}^{k}x'_{n}, {}^{k}y'_{n}, c' \end{bmatrix} \begin{bmatrix} E_{11} & E_{12} & E_{13} \\ E_{21} & E_{22} & E_{23} \\ E_{31} & E_{32} & E_{33} \end{bmatrix} \begin{bmatrix} {}^{k}x''_{n} \\ {}^{k}y''_{n} \\ c'' \end{bmatrix} = 0$$

As for the Fundamental Matrix...

Which constraints to consider?

Constraints

• For the fundamental matrix, we enforced the rank(F) = 2 constraint

$$\mathsf{F} = UDV^{\mathsf{T}} = U \begin{bmatrix} D_{11} & 0 & 0 \\ 0 & D_{22} & 0 \\ 0 & 0 & 0 \end{bmatrix} V^{\mathsf{T}}$$

 For the essential matrix, both nonzero singular values are identical

$$E = U \begin{bmatrix} d & 0 & 0 \\ 0 & d & 0 \\ 0 & 0 & 0 \end{bmatrix} V^{\mathsf{T}} = U \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 0 \end{bmatrix} V^{\mathsf{T}}$$

homogenous

More details: Förstner, Skript Photogrammetrie II, Sect 1.2.3 47

8-Point Algorithm for the Essential Matrix

```
1 function E = E_from_point_pairs(xs, xss)
  % xs, xss: Nx3 homologous point coordinates, N > 7
2
   % E: 3x3 essential matrix
3
4
   % coefficient matrix
5
  for n = 1 : size(xs, 1)
6
                                                   build matrix A
    A(n, :) = kron(xss(n, :), xs(n, :));
\overline{7}
8
   end
9
10 % singular value decomposition
                                                        solve Ae=0
   [U, D, V] = svd(A);
11
12
   % approximate E, possibly regular
13
                                                  build matrix Ea
  Ea = reshape(V(:, 9), 3, 3);
14
15
   % svd decomposition of E
16
                                              compute SVD of Ea
   [Ua, Da, Va] = svd(Ea);
17
18
  % algebraically best E, singular, sanbuild matrix E from Ea
19
                                       by imposing constraints
  E = Ua * diag([1, 1, 0]) * Va';
20
```

Conditioning/Normalization to Obtain a Well-Conditioned Problem (As Done Before)

- As for the 8-Point algorithm for the fundamental matrix, normalization of the point coordinates is essential
- Transform the points so that the center of mass of all points is at (0,0)
- Scale the image so that the x and y coordinated are within [-1,1]

Conditioning/Normalization

- Define $T : Tx = \hat{x}$ so that coordinates are zero-centered and in [-1,1]
- Determine essential matrix Ê from the transformed coordinates

$$^{k}\mathbf{x}'^{\mathsf{T}}\mathsf{E} \ ^{k}\mathbf{x}'' = (\mathsf{T}^{-1} \ ^{k}\mathbf{\hat{x}}')^{\mathsf{T}}\mathsf{E}(\mathsf{T}^{-1} \ ^{k}\mathbf{\hat{x}}'')$$

$$= \ ^{k}\mathbf{\hat{x}}'^{\mathsf{T}}\mathsf{T}^{-\mathsf{T}}\mathsf{E}\mathsf{T}^{-1} \ ^{k}\mathbf{\hat{x}}''$$

$$= \ ^{k}\mathbf{\hat{x}}'^{\mathsf{T}}\mathbf{\hat{E}} \ ^{k}\mathbf{\hat{x}}''$$

Obtain essential matrix E through

$$\stackrel{\hat{\mathsf{E}}}{\Rightarrow} \begin{array}{c} \hat{\mathsf{E}} \\ \mathsf{E} \end{array} = \begin{array}{c} \mathsf{T}^{-\top}\mathsf{E}\mathsf{T}^{-1} \\ \mathsf{T}^{\top}\hat{\mathsf{E}}\mathsf{T} \end{array}$$

Properties of the Essential Mat.

- Homogenous
- Singular: $|\mathsf{E}| = 0$ (determinant is zero)
- Two identical non-zero singular values

$$\mathsf{E} = U \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 0 \end{bmatrix} V^{\mathsf{T}}$$

• As a result of the skew-sym. matrix: $2\mathsf{E}\mathsf{E}^{\mathsf{T}}\mathsf{E} - \mathrm{tr}\,(\mathsf{E}\mathsf{E}^{\mathsf{T}})\mathsf{E} = \mathbf{0}_{3\times 3}$

5-Point Algorithm

5-Point Algorithm

- Proposed by Nistér in 2003/2004
- Standard solution today to obtaining the direct solution
- Solving a polynomial of degree 10
- 10 possible solutions
- Often used together RANSAC
 - RANSAC proposes correspondences
 - Evaluate all 5-point solutions based on the other corresponding points

5-Point Algorithm

- More details in the script by Förstner "Photogrammetrie II", Ch 1.2
- Stewenius, Engels, Nistér: "Recent Developments on Direct Relative Orientation", ISPRS 2006
- Li and Hartley: "Five-Point Motion Estimation Made Easy"

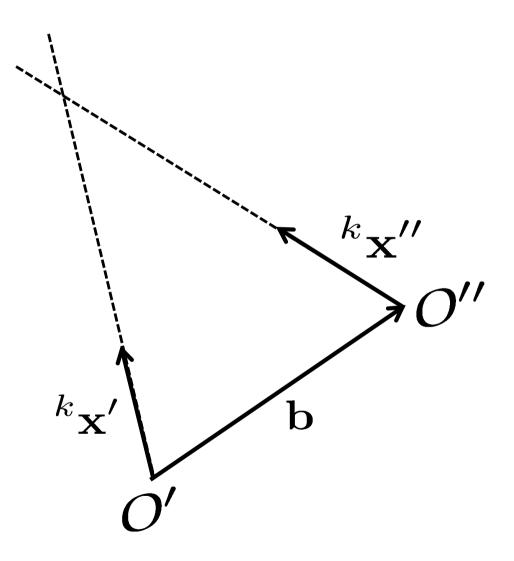

Computing the Orientation Parameters Given the Essential Matrix

Compute Basis and Rotation Given E

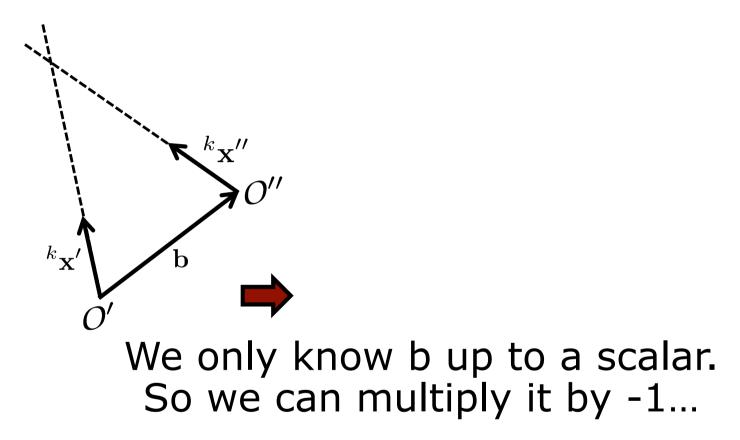

• In short: $E \rightarrow S_B, R$

Question: Is there a unique solution?

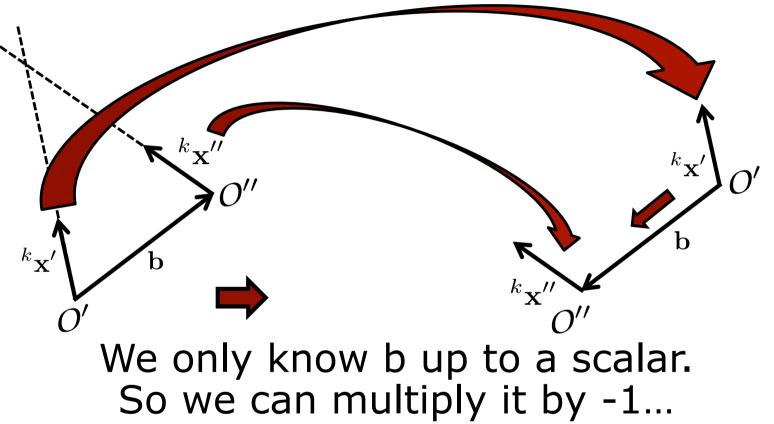

The Solution We Want...

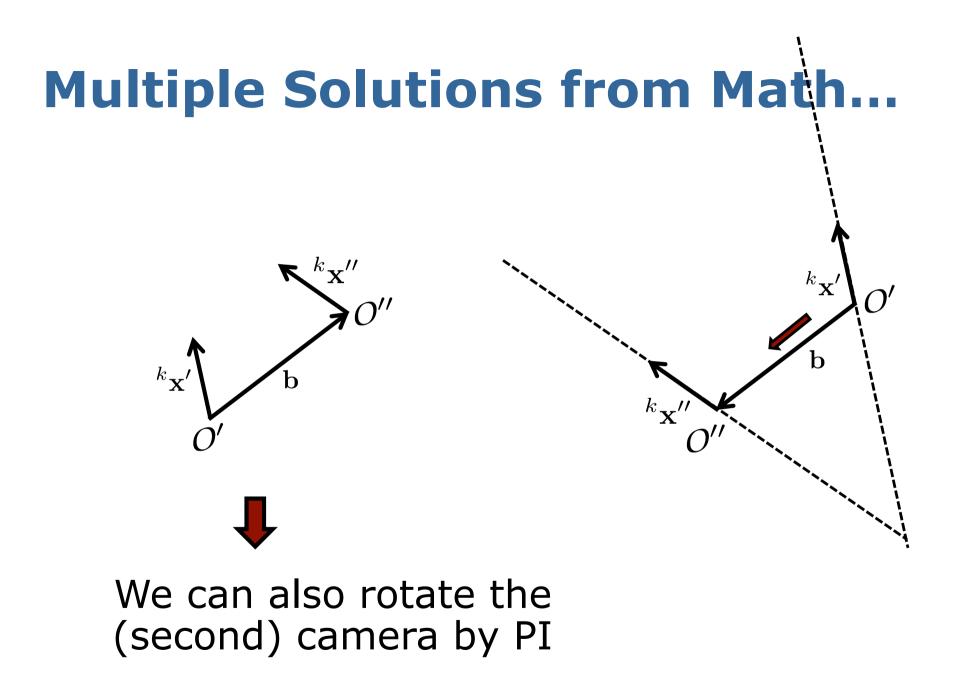

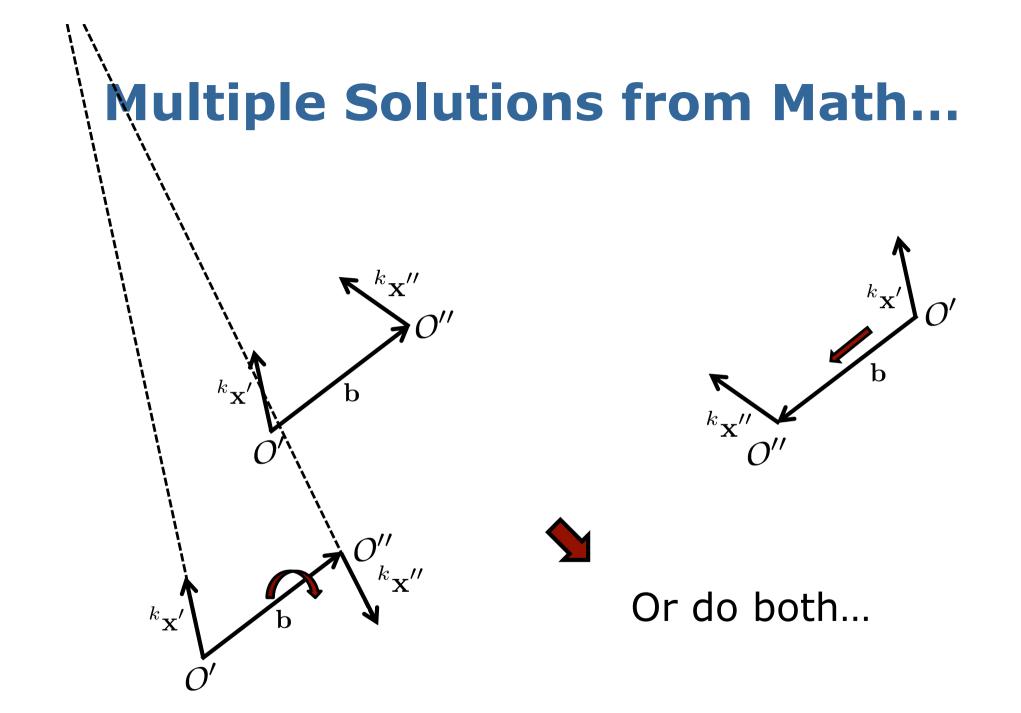

Multiple Solutions from Math...

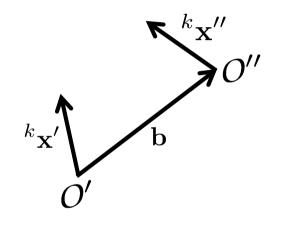

Multiple Solutions from Math...

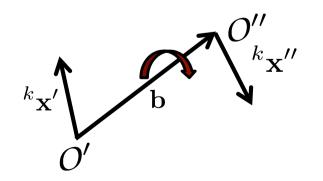

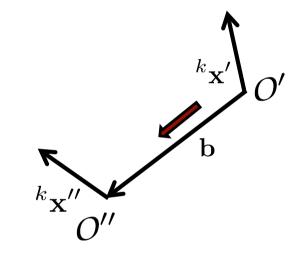

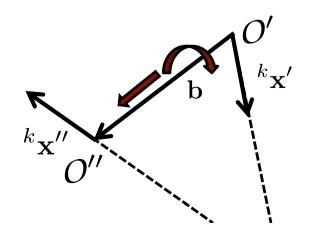

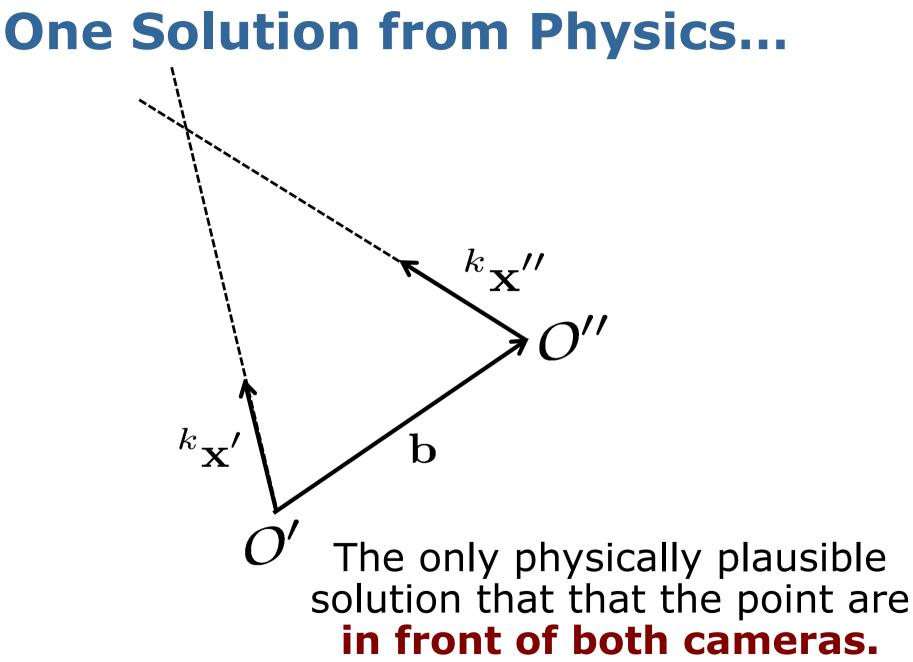

Four Possible Solutions from Math...

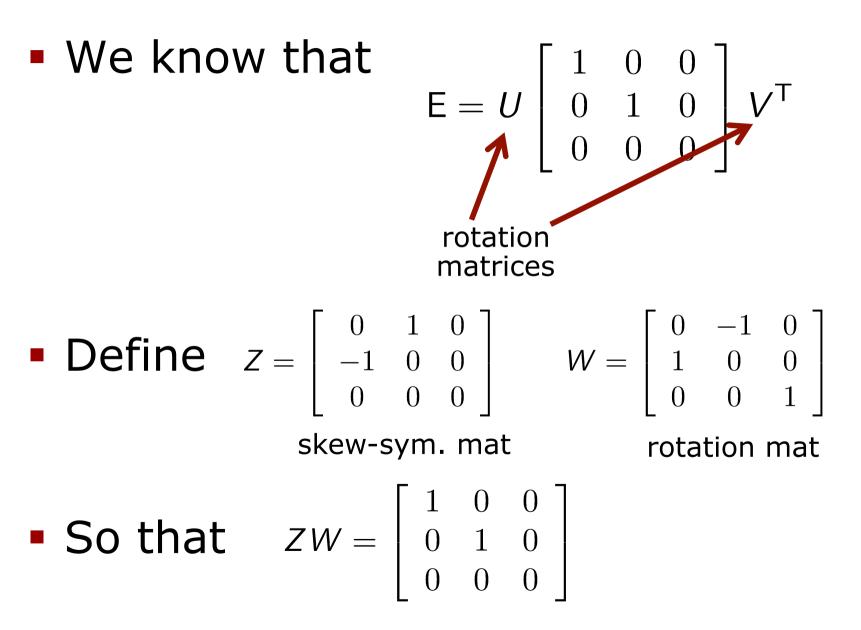

Algebraic Solution for Obtaining the Basis and Rotation Matrix Given the Essential Matrix

We know that

$$\mathsf{E} = U \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 0 \end{bmatrix} V^\mathsf{T}$$
rotation matrices

$$E = U \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 0 \end{bmatrix} V^{\mathsf{T}}$$
$$= U \underbrace{\begin{bmatrix} 0 & 1 & 0 \\ -1 & 0 & 0 \\ 0 & 0 & 0 \end{bmatrix}}_{Z} \underbrace{\begin{bmatrix} 0 & -1 & 0 \\ 1 & 0 & 0 \\ 0 & 0 & 1 \end{bmatrix}}_{W} V^{\mathsf{T}}$$

$$E = U \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 0 \end{bmatrix} V^{\mathsf{T}}$$

$$= U \begin{bmatrix} 0 & 1 & 0 \\ -1 & 0 & 0 \\ 0 & 0 & 0 \end{bmatrix} \begin{bmatrix} 0 & -1 & 0 \\ 1 & 0 & 0 \\ 0 & 0 & 1 \end{bmatrix} V^{\mathsf{T}}$$

$$= UZ \underbrace{\bigcup^{\mathsf{T}} \bigcup^{\mathsf{T}} \bigcup^{\mathsf{W}} V^{\mathsf{T}}}_{I}$$

$$\Xi = U \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 0 \end{bmatrix} V^{\mathsf{T}}$$

$$= U \begin{bmatrix} 0 & 1 & 0 \\ -1 & 0 & 0 \\ 0 & 0 & 0 \end{bmatrix} \begin{bmatrix} 0 & -1 & 0 \\ 1 & 0 & 0 \\ 0 & 0 & 1 \end{bmatrix} V^{\mathsf{T}}$$

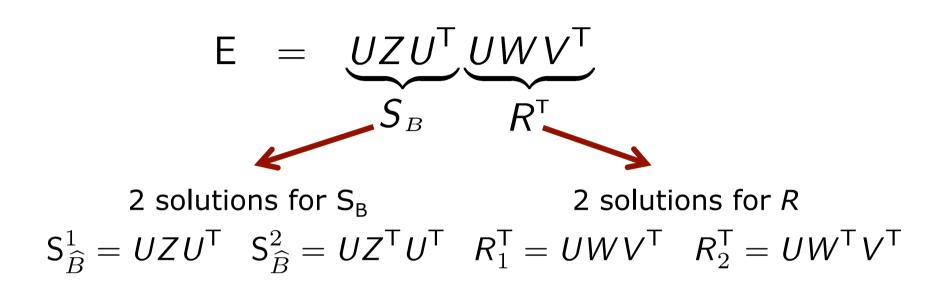

$$= UZ \underbrace{U^{\mathsf{T}}U}_{I} W V^{\mathsf{T}}$$

$$= \underbrace{UZ U^{\mathsf{T}}}_{S_{B}} \underbrace{UW V^{\mathsf{T}}}_{R^{\mathsf{T}}}$$

Four Possibilities to Define Z, W

$$\begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 0 \end{bmatrix} = ZW = \begin{bmatrix} 0 & 1 & 0 \\ -1 & 0 & 0 \\ 0 & 0 & 0 \end{bmatrix} \begin{bmatrix} 0 & -1 & 0 \\ 1 & 0 & 0 \\ 0 & 0 & 1 \end{bmatrix}$$
$$= -Z^{\mathsf{T}}W = -\begin{bmatrix} 0 & 1 & 0 \\ -1 & 0 & 0 \\ 0 & 0 & 0 \end{bmatrix}^{\mathsf{T}} \begin{bmatrix} 0 & -1 & 0 \\ 1 & 0 & 0 \\ 0 & 0 & 1 \end{bmatrix}$$
$$= -ZW^{\mathsf{T}} = -\begin{bmatrix} 0 & 1 & 0 \\ -1 & 0 & 0 \\ 0 & 0 & 0 \end{bmatrix} \begin{bmatrix} 0 & -1 & 0 \\ 1 & 0 & 0 \\ 0 & 0 & 1 \end{bmatrix}^{\mathsf{T}}$$
$$= Z^{\mathsf{T}}W^{\mathsf{T}} = \begin{bmatrix} 0 & 1 & 0 \\ -1 & 0 & 0 \\ 0 & 0 & 0 \end{bmatrix}^{\mathsf{T}} \begin{bmatrix} 0 & -1 & 0 \\ 1 & 0 & 0 \\ 0 & 0 & 1 \end{bmatrix}^{\mathsf{T}}$$

Yields Four Solutions

- Compute the SVD of $E: UDV^T = svd(E)$
- Normalize U, V by U = U|U|, V = V|V|
- Compute the four solutions

 $\mathbf{S}_{\widehat{B}}^{1} = \boldsymbol{U}\boldsymbol{Z}\boldsymbol{U}^{\mathsf{T}} \quad \mathbf{S}_{\widehat{B}}^{2} = \boldsymbol{U}\boldsymbol{Z}^{\mathsf{T}}\boldsymbol{U}^{\mathsf{T}} \quad \boldsymbol{R}_{1}^{\mathsf{T}} = \boldsymbol{U}\boldsymbol{W}\boldsymbol{V}^{\mathsf{T}} \quad \boldsymbol{R}_{2}^{\mathsf{T}} = \boldsymbol{U}\boldsymbol{W}^{\mathsf{T}}\boldsymbol{V}^{\mathsf{T}}$

- Test for which solutions all points are in front of both cameras
- Return the physically plausible configuration

Summary (1)

- Algorithms to compute the relative orientation from image data
- Allow us to estimate the camera motion (except of the scale)
- Direct solutions
 - F from N>7 points ("8-Point Algorithm")
 - E from N>7 points ("8-Point Algorithm")
 - E from N=5 points ("Nister's 5-Point Algorithm")

Summary (2)

- Direct solutions
- Extracting S_B, R from E
- Not statistically optimal
- Often used in combination with RANSAC for identifying in/outliers
- Direct solutions & RANSAC serves as initial guess for iterative solutions
- Subsequent refinement using least squares only based on inlier points

Slide Information

- The slides have been created by Cyrill Stachniss as part of the photogrammetry and robotics courses.
- I tried to acknowledge all people from whom I used images or videos. In case I made a mistake or missed someone, please let me know.
- The photogrammetry material heavily relies on the very well written lecture notes by Wolfgang Förstner and the Photogrammetric Computer Vision book by Förstner & Wrobel.
- Parts of the robotics material stems from the great
 Probabilistic Robotics book by Thrun, Burgard and Fox.
- If you are a university lecturer, feel free to use the course material. If you adapt the course material, please make sure that you keep the acknowledgements to others and please acknowledge me as well. To satisfy my own curiosity, please send me email notice if you use my slides.

Cyrill Stachniss, cyrill.stachniss@igg.uni-bonn.de, 2014
